                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes an isolated polynucleotide (I) comprising a fully defined (S1) of 749, 3188, 2484, 1169, 2936, 1467, 5773, 5714, 4041, 1372, 3996, 3945, 2735, 1788, 585, 1782, 927, 5714 or 2282 nucleotides as given in the specification, its translated or protein coding portion, its extracellular portion or its active domain. The GPCR-like polypeptides and polynucleotides are useful for the treatment of diseases of ophthalmic, neurological, immunological and nephritic systems. They may also be used to treat hormonal dysfunction, cancer, atherosclerosis and diabetes. The antibodies are useful for detecting or quantitating the polypeptide in trissue. The polypeptides can also be used as molecular weight markers and as a food supplement. This sequence represents a human polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tang

                                                                                                                                      The invention relates to a polynucleotide comprising a sequence given in the specification, or its mature protein-coding portion, or its complement. The polynucleotide is useful for treating diseases e.g., cancer or neurodegenerative diseases and many others listed in the specification. The present sequence represents a novel human cDNA. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at sequence.html?DocID=20030104529.

Claim 1; Page 168-169; 175pp; English.

asthma, ischaemia-reperfusion, multiple sclerosis, rejection of organ or tissue transplants, chronic obstructive pulmonary disease, inflammatory bowel disease, Crohn's disease, ulcerative colitis, inacute respiratory disease, systemic lupus erythematosus, autoimmune disease, cystic fibrosis, cancers, tumours or neoplasms. This inflammation-related disease or disorder also includes disorders associated with aberrant activation of the TNF-alpha pathway, disorders associated with aberrant cellular migration, proliferation, metastasis, juvenile idiopathic arthritis, haematogenous metastases of tumour cells, hyperinsulinaemia, diabetes type 2, atherosclerosis, cardiovascular disease. colon associated with aberrant care colon as the colon as involved in intracellular signaling cascade. The RET16 genes and proteins, polynucleotide is useful for treating an inflammation-related disease c disorder, e.g. rheumatoid arthritis, juvenile arthritis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to human nucleic acids (AA157798-AA161369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemotheric activity, haemostatic activity, haemostatic activity, chemotactic/chemotheric activity, haemostatic and thoraphy and activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                    and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tang

                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid molecule encoding a CC channel/transporter protein or sequences at least 95% identical to a CC these. The nucleic acids and proteins encoded by them are used to CC prevent, treat or ameliorate a medical condition in e.g. humans, mice, CC rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a cCC in diagnosing a pathological condition or susceptibility to a cCC immunoassays e.g. radioimmunoassays or enzyme linked immunoasorbent assays (ELLSA). Disorders which are diagnosed or treated include autoimmune CCC (ELLSA). Disorders which are diagnosed or treated include autoimmune CCC arrest, cerebrovascular disorders e.g. cerebroral ischemia, angiogenesis, CCC nervous system disorders e.g. alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. CCC bacteria, viruses and fungi and ocular disorders e.g. corneal infection. CCC corneal proliferation, to prevent skin aging due to sunburn, to maintain CCC coll proliferation, to prevent skin aging due to sunburn, to maintain CCC organs before transplantation, for supporting cell culture of primary CCC insues, to regenerate tissues and in chemotraxis. The polypeptides can also be used as a food additive or preservative to increase or decrease contends can be observed as a food additive or preservative to increase or decrease contends in the contends to a gene of the contends to the contends to a gene of the contends to the contends to a gene of the contends to the contends to a

REFERENCE AUTHORS TITLE JOURNAL REMARK REFERENCE AUTHORS TITLE JOURNAL ACCESSION VERSION KEYWORDS SOURCE LOCUS DEFINITION RESULT 1 CR607851 FEATURES COMMENT ORGANISM source Submitted (20-JUL-2004) Genoscope - Centre National de Sequencage: BP 191 91006 EVRY cedex - FRANCE (B-mail: seqref@genoscope.cns.fr - Web: www.genoscope.cns.fr)

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen. - Web: www.genoscope.cns.fr)
let strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen.

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
                                                                          1 (bases 1 to 889)

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoRV sites of the pCNVSPORT 6 vector. Library
was not normalized. Library was constructed by Life Technologies, a
division of Invitrogen.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     seq length: 0
